THE EDGE OF THE FANTASTIC

GRAVITATION

Anisimov, correspondent

Room is almost empty: the only table is the table, on it - the
 tennis ball/sphere, friction watch boxes, pencils. As soon enters the
 room, it approaches the table. It stretches above object/subjects
 head. And it falls. But according to the expression of its face, on
 the intensity/strength of pose it is evident that it simply will not
 rest - it "works". Passes minute, another. And suddenly, has begun to

move on table ball/sphere, then was moved from the place of boxes, pencil. Man moved them, not touching them with his hand.

This person is a Muscovite Boris Vladimirovich Yacobiav. And its surprising abilities it demonstrates in the laboratory of the doctor of psychological sciences, professor V. N. Pushkin. A noted specialist in the field of psychology, the Moscow scientist conducts exceptional through interest and significance experiments. among them special place occupy the works, bonded with the phenomenon of telekinesis. Is which the mechanism of this phenomenon, is what its secret/secretions? These questions professor V. N. Pushkin answers our correspondent.

- Speaking about the nature of telekinesis, it is necessary to note that one of the first attempts to explain the ability of man to move object/subjects was bonded with static electricity. Specifically, it was assumed that to the object/subject about which is located the hand of man, they act the electric charges which move him.

I itself shared this point of view and even found as to be it seemed the completely scientific name: the controlled bioelectric field in the structure of the object action/effect of man. Under this name telekinesis was discussed at the IX international congress of

psychologists in Tokyo during August 1972.

But the further observations and the speculations led to the not-very-comforting conclusion/derivations relative to the role of static electricity in telekinesis. Those manifestations of the reaction of man with the object/subjects which for as it was possible to observe, cannot be explained by the static-charges, which appear on the surface of object/subjects.

In connection with this I focused attention on scholarly A. P. Dubrov's hypothesis. Its essence lies in the fact that the living systems are capable of giving birth to and receiving gravity waves. This phenomenon was called biogravitation.

Hence it arose moistening the thought: to examine telekinesis as the certain form of gravitational reaction. Of course, here appear the very essential difficulties: necessary to recognize to higher degree the unusual position about the fact that the man is capable to give birth to gravitational field and with its aid to influence some surrounding object/subjects. To me it was brought to observe the very powerful manifestation of the tele-kinetic ability of the Muscovite of Boris Vladimirovich Ersolev.

The singularity of experiments gives grounds in more detail to

stop at them.

Each time we began experiments on Ersolev on "lifting-up". I. e., it made the fact that for usual telekinetic specialists is the top of the intensity/strength of their mental form: it moved object/subjects. After this, holding above the inverted map/charts hand, it determined their color and significant figures. Then began the most important part of the experiment. Ersolev took into his any object/subject, he clasped his between palms and ... gradually/ separate/expanded hands. Object/subject hang in air. The distance between it and palms reaching to twenty centimeters. It is interesting to note and one additional essential part. The greater was the area of object/subject, the longer it hovered.

If we attempt to explain these facts from the viewpoint of classical physics, then appears a whole series of difficulties. First of all it is obvious that in this case is inapplicable in its direct/straight form/species the law of universal gravitation of Newton.

Therefore for the explanation of telekinesis, for its physical analysis remains one theory of contemporary physics - general theory of relativity.

But before how to raise the question concerning the possibility of applying the positions of this theory to the human organism and to the analysis of his mental activity, it is necessary to show that the dynamics of the entering the organism elementary particles really/actually occurs. Was conducted experimental study with the aid of the method of the photographing in high-frequency currents, proposed by Soviet inventors V. and by S. Kirlianami.

Experiment consisted in the fact that the finger/pin of the participating in experiments person into continuation 0.0001 second was located in the electric field of high frequency. After this the surface of skin began to glow, and brightness it was possible to imprint on photographic film. As a rule, it took the form of the corona, consisting of the determined quantity of discharge ray/beams. Photographing occurred to and during the expressed mental activity: tested it had to complete in mind surgery of the multiplication of numbers. As a result it was explained that with the increased mental activity the discharge corona glows less intensively.

This shift/shear in a quantity of discharge ray/beams, which appear on the surface of skin, means that at the torque/moment of transition from calm state to the increased mental activity in the human organism appear the forces, which affect the surface of skin, they join the particles, arrange/located on surface, and is

record/fixed their position.

The role of elementary particles, their dynamics in the informational processes of brain could be assessed and earlier. However, the comparison of the facts of the reaction of man with objects (telekinesis) makes it possible to draw already the theory of relativity to the analysis of the informational work of human brain and to express hypothesis about the fact that in experiments with Ersolev object/subjects influenced the gravitational field, since object/subjects themselves were dielectric and the effect of suspension/mounting did not depend on their mass.

It goes without saying that that gravitation, which it was possible to observe in experiments on Ersolev, differs from gravitation in the universe with which usually it got accustomed to deal of man. Such differences several. And main of them lies in the fact that the gravitation, given birth to man, does not exist constantly, but it appears in the determined situation. After arising, it it oscillates, first being increased, then decreasing. As concerns its precise scientific definition, the most approaching for it name - autogravitation. Autogravitation in that case as result of the complete systematic nature of organism, it is the variety/subspecies of wider concept, biogravitation.

Which function can fulfill gravitation in the human organism, if we consider it not as property of the determined piece of matter, which interacts with its other pieces, but from biological and psychological points of view?

Analysis makes it possible to exarticulate at least two such functions. The first is bonded with the need for retaining the physical completeness of organism. The second makes it possible to express hypothesis about the fact that the gravitation materially provides the mental activity of man.

Indeed man lives among the objects of the different degree of organization. And in order to perceive these objects in order to construct in the head of their model, he must bend space in accordance with the curvature of the gotten to know objects. So it appears the autogravitation of man. Thus about which communication/connection between psychology and physics testify, apparently, these experiments. According to the common/general/total theory of relativity gravitation appears in such systems, in which is bent the space.

The traditions of science lay the determined taboo on those field, which are bonded with the disturbance/breakdown of the fundamental laws of nature. No one of the respecting itself

scientists will not begin to be occupied by the problems of the construction of perpetual motion machine or to create the theory, which assesses the disturbance/breakdown of the law of conservation of substance. The ability of man to exert influence on the arranged/located about it object/subjects (ability to telekinesis) even now is considered by some researchers as something relating to the field of the disturbance/breakdown of the fundamental laws of nature.

One of the results of the analysis conducted is the conclusion that the facts of telekinesis with their entire singularity and astonishing nature do not contradict the existing physical picture of world.

As concerns the scientific prospects for the further work on research on telekinesis, first of all it is necessary to note the difficulties, which appear in connection with the singularity of this phenomenon.

Fundamental complexity lies in the fact that the person, who possesses of this type abilities, not always can by these abilities control. We remember the case with the so-called skin view. at one time was written about Rose Kuleshova, which could distinguish by the skin of color and even objects. Several boards on the basis of

experiments with the most precise spectral equipment they recognized that the fact of peculiar "skin view" really/actually exists. Then it turned out that this property of Kuleshova it weakened. And when the next board began to check phenomenon, tested could not show that it was skillful. But indeed this effect actually exists. Evidence to that - five volumes of the investigations, carried out by Ural psychologists with a large quantity of tested.

Are known the works of the outstanding Soviet psychologist, active member of the Academy of pedagogical Sciences of the USSR A. N. Leont'yev, who could manufacture the conditioned reflex of photic action on the skin of the finger/pin of man. Tested ill not know, at which torque/moment its finger/pin will be illuminated by the outbreak of world/light, following which was deposited the shock by current. The experiments showed that the participating in experiments people learned to jerk back hand after the outbreak of world/light.

Therefore telekinesis as one of the facts of this type in this stage of study needs serious theoretical and experimental development.

It is not necessary to fear new facts and complex problems. In our world of high-speed aircraft and atomic reactors remained still much that is that which was unrecognized. And science must open the mysteries of world.
